Addressing Review by Team 9

Design

The ProfilePictureViewController doesn't access the DAO anymore. This is handled through the UserService now.

The Exception system has been overhauled and changed, so the ExceptionService doesn't exist anymore. The provided functionality is now in a utility class called ExceptionHelper.

The addProfilePictureInfoToModel method has been moved from the service to the controller according to the feedback.

Coding Style

It seems like most of the code was found to be fine.

Documentation

Class documentation has been looked at and added where found necessary.

Testing

Links to the tested classes have been added.

The line length in the ProfileEditControllerTest as well as in other places, if needed, have been reduced.

The folder structure has been changed according to the standard.

AssertArrayEquals has also been implemented.
